

Our research topic back in my senior high school is entitled “CAUSES OF DRINKING ALCOHOL TO SENIOR HIGH SCHOOL STUDENTS IN LURAY II NATIONAL HIGH SCHOOL”. This research topic is a Quantitative Research which calculates the percentage of students who choose a domain caused that leads them to take alcohol. In our statement of the problem, we include 3 domain causes, Social Ease, Uneasiness Behavior, and Economic Aspect. Based on the findings of the study, the uneasiness behavior has the highest computed weighted mean. This shows us that overcoming or preventing alcohol consumption driven by uneasiness behavior involves building resilience, fostering healthy habits, and addressing underlying causes.

This research topic is important because it sheds light on the underlying causes of alcohol consumption among senior high school students, particularly uneasiness behavior, helping educators, parents, and policymakers develop effective interventions to promote healthier coping mechanisms and prevent substance abuse at a critical stage in students' lives. By understanding these causes, we can create support environments and strategies to foster resilience and reduce the long-term negative impacts of alcohol consumption on youth and society.
